STACK · THE GREAT PICK FOR EACH JOB

How to Set Up the 6 Tools From the Bad, Good, Great Video

Dennis · Sr PM at Microsoft · @dennisthinks_

1 Typing: Wispr Flow

Install it and sign in. Put your cursor anywhere you'd type, hold the Flow hotkey, talk like you're explaining it to a coworker, then let go. It types a cleaned-up version right where your cursor is.

In your first week, add your team's names, product names and acronyms to its dictionary. That's what stops it from spelling your project name three different ways.

> EXAMPLE
>
> You say: "Quick update for Priya, the migration slipped two days because the auth team is out, new date is Thursday, I'll confirm Wednesday."
>
> Flow types it into Slack as a clean, punctuated message you can send as is.

Start with Slack replies and email first drafts. Those are the things you already explain out loud.

2 Meeting notes: Granola

Install it on your laptop and connect your calendar. It listens through your computer's audio, so no bot joins the call and nobody sees a recorder in the room.

During the meeting, type only the few words that matter to you. When the call ends, Granola fills those lines in from what was actually said. Pick a template that fits the meeting, like a 1:1, a standup or a customer call.

> EXAMPLE
>
> You type "pricing pushback" and "Q3 date?" during the call.
>
> Afterward those two lines turn into what the customer said about price, the date everyone agreed on, and a list of who owes what.

Tell people you're taking AI notes, every time. Then send the action items before you leave your desk.

3 Status updates: Claude Projects

Create a Project called Weekly Update. Upload your last four to six updates and your team's goals. Paste the prompt below into the project instructions. Every Friday, open the project, paste your rough notes and ask for this week's update.

> EXAMPLE
>
> "You write my weekly status update for my manager. Match the tone and length of the past updates in this project. Start with what shipped and what it changed for the team or the customer. Then list risks, each with the date at risk and what I need to fix it. Keep it under 150 words. If my notes are missing a number or a date, ask me instead of guessing."

Read the draft out loud once before you send it. If a line sounds like something you'd never say, cut it.

4 Specs: ChatPRD

Start from its PRD template instead of a blank chat. Give it three things: the problem, who has it, and what success looks like as a number. Let it draft, then ask it to poke holes before your engineers do.

> EXAMPLE
>
> "Draft a one-page PRD. Problem: [who] can't [do what] today, so [what it costs]. Goal: move [metric] from [X] to [Y] by [date]. Out of scope: [list]. Then list the five questions my engineering lead will ask first."

Bring those five questions to your kickoff with the answers already written.

5 Decks: Gamma

Write the outline before you open Gamma. One line per slide, written as the sentence you'd say out loud in the meeting. Paste it in and generate. Set your company colors once and put your time into the words.

> EXAMPLE
>
> 1. We lost [X] deals last quarter because setup takes too long.
> 2. Setup takes [X] days. Our closest competitor takes [Y].
> 3. Two fixes get us under [Z] days.
> 4. We need one engineer for six weeks.

If someone reads only your slide titles, they should still get the whole argument.

6 Research: NotebookLM

Make one notebook per question. Add only sources you trust, like your customer interview notes, competitor pages or a report your team already uses. It answers from those sources and shows you where each answer came from.

> EXAMPLE
>
> "Across these interviews, what are the top three reasons customers leave? Quote the exact line for each one and tell me which interview it came from."

Before you repeat a claim in a meeting, click its citation and read the original line.

7 Before you start

Check your company's AI policy before you put any work document into one of these tools. If a tool isn't approved, use it on your own notes and drafts only.

- [ ] Checked my company's AI policy for each tool
- [ ] Added team names and acronyms to the Wispr Flow dictionary
- [ ] Connected my calendar to Granola and picked a template
- [ ] Uploaded four to six past updates to my Claude Project
- [ ] Wrote my next deck as an outline before opening Gamma
- [ ] Made one NotebookLM notebook for the question I'm working on now
